

Approved Package Insert

SCHEDULING STATUS:

S4

PROPRIETARY NAME AND DOSAGE FORM:

XARELTO® 15 Film-coated tablets

XARELTO® 20 Film-coated tablets

COMPOSITION:

XARELTO 15: Each film-coated tablet contains rivaroxaban 15 mg.

XARELTO 20: Each film-coated tablet contains rivaroxaban 20 mg.

Other ingredients:

Tablet core: cellulose microcrystalline, croscarmellose sodium, hypromellose 5 cP, lactose monohydrate, magnesium stearate, sodium lauryl sulphate.

Film-coat: ferric oxide red E172, hypromellose 15 cP, macrogol 3350, titanium dioxide E171.

PHARMACOLOGICAL CLASSIFICATION:

A 8.2 Anticoagulants

PHARMACOLOGICAL ACTION:

Pharmacodynamic properties:

Mechanism of action:

Rivaroxaban is a highly selective direct factor Xa inhibitor with oral bioavailability.

Activation of factor X to factor Xa (FXa) via the intrinsic and extrinsic pathway plays a central role in the cascade of blood coagulation. FXa directly converts prothrombin to thrombin through the prothrombinase complex, and ultimately, this reaction leads to fibrin clot formation and activation of platelets by thrombin. One molecule of FXa is able to generate more than 1000 molecules of thrombin due to the amplification nature of the coagulation cascade. In addition, the reaction rate of prothrombinase-bound FXa increases 300 000-fold compared to that of free FXa and causes an explosive burst of thrombin generation.

Selective inhibitors of FXa can terminate the amplified burst of thrombin generation. Consequently, several specific and global clotting tests are affected by rivaroxaban. Dose dependent inhibition of factor Xa activity was observed in humans.

Pharmacodynamic effects:

Dose dependent inhibition of factor Xa activity was observed in humans. Prothrombin time (PT) is influenced by rivaroxaban in a dose dependent way with a close correlation to plasma concentrations (r value equals 0,98) if Neoplastin® is used for the assay. Other reagents would provide different results. The readout for PT is to be done in seconds, because the INR (International Normalised Ratio) is only calibrated and validated for coumarins and cannot be used for any other anticoagulant.

In patients receiving rivaroxaban for treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE) and prevention of recurrent DVT and PE, the 5/95 percentiles for PT (Neoplastin®) 2 to 4 hours after tablet intake (i.e. at the time of maximum effect) ranged from 17 seconds to 32 seconds for 15 mg twice daily or 15 seconds to 30 seconds for 20 mg once daily, respectively.

In patients with non-valvular atrial fibrillation receiving rivaroxaban for the prevention of stroke and systemic embolism, the 5/95 percentiles for PT (Neoplastin®) 1 to 4 hours after tablet intake (i.e. at the

Approved Package Insert

time of maximum effect) ranged from 14 seconds to 40 seconds in patients treated with 20 mg once daily and from 10 seconds to 50 seconds in patients with moderate renal impairment treated with 15 mg once daily.

The activated partial thromboplastin time (aPTT) and HepTest® are also prolonged dose-dependently; however, they are not recommended to assess the pharmacodynamic effect of rivaroxaban.

Anti-factor Xa activity is also influenced by rivaroxaban; however no standard for calibration is available.

Pharmacokinetic properties:

Absorption and bioavailability:

Rivaroxaban is rapidly absorbed with maximum concentrations (C_{max}) appearing 2 to 4 hours after tablet intake.

The oral bioavailability for the 20 mg tablet dose is 66 %, under fasting conditions. When rivaroxaban 20 mg tablets are taken together with food increases in mean AUC by 39 % were observed when compared to tablet intake under fasting conditions, indicating almost complete absorption and high oral bioavailability. Rivaroxaban 15 mg and 20 mg should be taken with food (see "Dosage and directions for use").

Under fed conditions rivaroxaban 15 mg and 20 mg tablets demonstrated dose-proportionality.

Variability in rivaroxaban pharmacokinetics is moderate with inter-individual variability (CV %) ranging from 30 % to 40 %.

Distribution:

Plasma protein binding in humans is high at approximately 92 % to 95 %, with serum albumin being the main binding component. The volume of distribution is moderate with V_{ss} being approximately 50 l.

Metabolism and elimination:

Of the administered rivaroxaban dose, approximately 2/3 undergoes metabolic degradation, with half then eliminated renally and the other half eliminated by the faecal route. The other 1/3 of the administered dose undergoes direct renal excretion as unchanged active substance in the urine, mainly via active renal secretion.

Rivaroxaban is metabolised via CYP 3A4, CYP 2J2 and CYP-independent mechanisms. Oxidative degradation of the morpholinone moiety and hydrolysis of the amide bonds are the major sites of biotransformation. Based on *in vitro* investigations rivaroxaban is a substrate of the transporter proteins P-gp (P-glycoprotein) and Bcrp (breast cancer resistance protein).

Unchanged rivaroxaban is the most important compound in human plasma with no major or active circulating metabolites being present. With a systemic clearance of about 10 l/h rivaroxaban can be classified as a low-clearance substance. Elimination of rivaroxaban from plasma occurred with terminal half-lives of 5 to 9 hours in young individuals, and with terminal half-lives of 11 to 13 hours in the elderly.

Special populations:

Geriatric patients:

Elderly patients exhibited higher plasma concentrations than younger patients with mean AUC values being approximately 1,5-fold higher, mainly due to reduced (apparent) total and renal clearance (see "Dosage and directions for use").

Different weight categories:

Extremes in body weight (< 50 kg versus > 120 kg) had only a small influence on rivaroxaban plasma

Approved Package Insert

concentrations (less than 25 %) (see “Dosage and directions for use”).

Children and adolescents:

Safety and efficacy have not been established for children and adolescents below 18 years (see “Dosage and directions for use”).

Hepatic impairment:

The effect of hepatic impairment on rivaroxaban pharmacokinetics has been studied in subjects categorised according to the Child Pugh classification, a standard procedure in clinical development. In patients for whom anticoagulation is intended, the critical aspect of liver impairment is the reduced synthesis of normal coagulation factors in the liver. Since this aspect is captured by only one of the five clinical/biochemical measurements composing the Child Pugh classification system, the bleeding risk in patients may not clearly correlate with this classification scheme.

Rivaroxaban is contra-indicated in patients with hepatic disease with or without coagulopathy (see “Contra-indications”).

Cirrhotic patients with mild hepatic impairment (classified as Child Pugh A) exhibited only minor changes in rivaroxaban pharmacokinetics (1,2-fold increase in rivaroxaban AUC on average), nearly comparable to their matched healthy control group. No relevant difference in pharmacodynamic properties was observed between these groups.

In cirrhotic patients with moderate hepatic impairment (classified as Child Pugh B), rivaroxaban mean AUC was significantly increased by 2,3-fold compared to healthy volunteers, due to significantly impaired drug clearance which indicates significant liver disease. Unbound AUC was increased 2,6-fold. There are no data in patients with severe hepatic impairment.

The inhibition of factor Xa activity was increased by a factor of 2,6 as compared to healthy volunteers; prolongation of PT was similarly increased by a factor of 2,1. The global clotting test PT assesses the extrinsic pathway that comprises of the coagulation factors VII, X, V, II, I which are synthesised in the liver. Patients with moderate hepatic impairment were more sensitive to rivaroxaban resulting in a steeper PK/PD relationship between concentration and PT.

No data are available for Child Pugh C patients (see “Dosage and directions for use” and “Contra-Indications”).

Renal impairment:

There was an increase in rivaroxaban exposure being inversely correlated to the decrease in renal function, as assessed via creatinine clearance measurements.

In individuals with mild (creatinine clearance \leq 80 to 50 ml/min), moderate (creatinine clearance $<$ 50 to 30 ml/min) or severe (creatinine clearance $<$ 30 to 15 ml/min) renal impairment, rivaroxaban plasma concentrations (AUC) were 1,4; 1,5 and 1,6-fold increased respectively as compared to healthy volunteers (see “Warnings” and “Dosage and directions for use”).

Corresponding increases in pharmacodynamic effects were more pronounced (see “Warnings” and “Dosage and directions for use”).

In individuals with mild, moderate or severe renal impairment the overall inhibition of factor Xa activity was increased by a factor of 1,5; 1,9 and 2,0 respectively as compared to healthy volunteers; prolongation of PT was similarly increased by a factor of 1,3; 2,2 and 2,4 respectively.

There are no data in patients with creatinine clearance $<$ 15 ml/min. Use is not recommended in patients with creatinine clearance $<$ 15 ml/min.

Approved Package Insert

Rivaroxaban is to be used with caution in patients with severe renal impairment (creatinine clearance < 30 to 15 ml/min) (see “Warnings” and “Dosage and directions for use”). Due to the underlying disease patients with severe renal impairment are at an increased risk of both bleeding and thrombosis.

Concomitant administration of strong CYP 3A4 inducers:

In a phase I trial, co-administration of rivaroxaban with the strong CYP 3A4 and P-gp inducer rifampicin led to an approximate 50 % decrease in mean rivaroxaban AUC, with parallel decreases in its pharmacodynamic effects (see “Interactions”).

In a Phase IIb trial, the PK/PD of an adapted rivaroxaban dosing regimen (30 mg twice daily in the first 3 weeks of treatment, followed by 20 mg twice daily) has been studied in 19 patients treated for DVT or PE and who concomitantly were medicated with a strong CYP 3A4 and P-gp inducer (rifampicin or phenytoin). The adapted dosing regimen in these patients led to a similar exposure and pharmacodynamics when compared to patients treated for DVT (15 mg twice daily in the first 3 weeks of treatment, followed by 20 mg once daily) without the concomitant administration of a strong CYP 3A4 inducer.

INDICATIONS:

XARELTO 15 and XARELTO 20 are indicated for:

- Prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation (SPAF).
- Treatment of deep vein thrombosis (DVT) and for the prevention of recurrent deep vein thrombosis (DVT) and pulmonary embolism (PE).
- Treatment of pulmonary embolism (PE) and for the prevention of recurrent pulmonary embolism (PE) and deep vein thrombosis (DVT).

CONTRA-INDICATIONS:

XARELTO 15 and XARELTO 20 are contra-indicated in patients with:

- Hypersensitivity to rivaroxaban or any excipient of the tablets.
- Clinically significant active bleeding (e.g. intracranial bleeding, gastrointestinal bleeding).
- Known existing inherited bleeding disorders.
- Hepatic disease with or without coagulopathy.

Safety and efficacy of XARELTO 15 and XARELTO 20 have not been established in pregnant women. Animal data show that rivaroxaban crosses the placental barrier. Therefore the use of XARELTO 15 and XARELTO 20 are contra-indicated throughout pregnancy (see “Pregnancy and lactation”).

Safety and efficacy of XARELTO 15 and XARELTO 20 have not been established in breastfeeding mothers. Animal data indicate that rivaroxaban is secreted into breast milk. Therefore XARELTO 15 and XARELTO 20 may only be administered after breastfeeding is discontinued (see “Pregnancy and lactation”).

WARNINGS:

Patients with prosthetic valves:

Safety and efficacy of XARELTO 15 and XARELTO 20 have not been studied in patients with prosthetic heart valves; therefore, there are no data to support that XARELTO 20 (XARELTO 15 in patients with moderate or severe renal impairment) provides adequate anti-coagulation in this patient population.

Bleeding risk:

XARELTO 15 and XARELTO 20 should be used with caution in patients with an increased bleeding risk such as:

Approved Package Insert

- Congenital or acquired bleeding disorders
- Uncontrolled severe arterial hypertension
- Active ulcerative gastrointestinal disease
- Recent gastrointestinal ulcerations
- Vascular retinopathy
- Recent intracranial or intracerebral haemorrhage
- Intraspinal or intracerebral vascular abnormalities
- Shortly after brain, spinal or ophthalmological surgery
- Bronchiectasis or history of pulmonary bleeding.

Care should be taken if patients are treated concomitantly with medicines affecting haemostasis such as non-steroidal anti-inflammatory medicines (NSAIDs), platelet aggregation inhibitors, or other antithrombotics (see “Interactions”).

For patients at risk of ulcerative gastrointestinal disease an appropriate prophylactic treatment may be considered (see “Interactions”).

Any unexplained fall in haemoglobin or blood pressure should lead to a search for a bleeding site.

Surgery and interventions:

If an invasive procedure or surgical intervention is required, XARELTO 15 and XARELTO 20 should be stopped at least 24 hours before the intervention, if possible and based on clinical judgement of the medical practitioner.

If the procedure cannot be delayed the increased risk of bleeding should be assessed against the urgency of the intervention.

XARELTO 15 and XARELTO 20 should be restarted after the invasive procedure or surgical intervention as soon as possible provided the clinical situation allows and adequate haemostasis has been established (see “Pharmacokinetic properties/metabolism and elimination”).

Neuraxial (epidural/spinal) anaesthesia:

When neuraxial (epidural/spinal) anaesthesia or spinal puncture is performed patients treated with antithrombotics for prevention of thromboembolic complications are at risk for development of an epidural or spinal haematoma, which may result in long-term paralysis.

The risk of these events is further increased by use of indwelling epidural catheters or the concomitant use of medicines affecting haemostasis. The risk may also be increased by traumatic or repeated epidural or spinal punctures.

Patients should be frequently monitored for signs and symptoms of neurological impairment (e.g., numbness or weakness of the legs, bowel or bladder dysfunction). If neurological deficits are noted, urgent diagnosis and treatment is necessary.

The medical practitioner should consider the potential benefit versus the risk before neuraxial intervention in patients who are anticoagulated or considered to be anticoagulated for thromboprophylaxis.

An epidural catheter should not be withdrawn earlier than 18 hours after the last administration of XARELTO 15 or XARELTO 20.

XARELTO 15 or XARELTO 20 should be administered not before 6 hours after the removal of the catheter.

If a traumatic puncture occurs, the administration of XARELTO 15 or XARELTO 20 should be delayed for 24 hours.

DVT and PE treatment – Renal impairment:

Approved Package Insert

XARELTO 15 and XARELTO 20 is to be used with caution in patients with moderate renal impairment (creatinine clearance < 50 to 30 ml/min) receiving co-medications leading to increased rivaroxaban plasma concentrations (see "Interactions").

SPAF, DVT and PE treatment – Renal impairment:

In patients with severe renal impairment (creatinine clearance < 30 ml/min) rivaroxaban plasma levels may be significantly elevated (1,6-fold on average) which may lead to an increased bleeding risk. Due to the underlying disease these patients are at an increased risk of both bleeding and thrombosis.

Due to limited clinical data XARELTO 15 and XARELTO 20 should be used with caution in patients with creatinine clearance < 30 to 15 ml/min.

No clinical data are available for patients with severe renal impairment (creatinine clearance < 15 ml/min). Therefore the use of XARELTO 15 and XARELTO 20 is not recommended in these patients (see "Dosage and directions for use", "Pharmacokinetic properties" and "Pharmacodynamic properties").

Patients with severe renal impairment or increased bleeding risk and patients receiving concomitant systemic treatment with azole-antimycotics or HIV protease inhibitors are to be carefully monitored for signs of bleeding complications after initiation of treatment.

Concomitant medication:

XARELTO 15 and XARELTO 20 are not recommended in patients receiving concomitant systemic treatment with azole-antimycotics (e.g. ketoconazole) or HIV protease inhibitors (e.g. ritonavir). These medicines are strong inhibitors of both CYP 3A4 and P-gp. Therefore, these medicines may increase rivaroxaban plasma concentrations to a clinically relevant degree which may lead to an increased bleeding risk (see "Interactions").

The azole anti-mycotic fluconazole, a moderate CYP 3A4 inhibitor, has however less effect on rivaroxaban exposure and can be co-administered (see "Interactions").

Women of childbearing potential:

XARELTO 15 and XARELTO 20 should be used in women of childbearing potential only with effective contraception.

QTc prolongation:

No QTc prolonging effect was observed with XARELTO 15 and XARELTO 20.

INTERACTIONS:

Pharmacokinetic interactions:

Rivaroxaban is cleared mainly via cytochrome P450-mediated (CYP 3A4, CYP 2J2) hepatic metabolism and renal excretion of the unchanged drug, involving the P-glycoprotein (P-gp)/breast cancer resistance protein (Bcrp) transporter systems (see "Pharmacokinetics").

CYP inhibition:

Rivaroxaban does not inhibit CYP 3A4 or any other major CYP isoforms.

CYP induction:

Rivaroxaban does not induce CYP 3A4 or any other major CYP isoforms.

Effects on XARELTO:

The concomitant use of XARELTO 15 or XARELTO 20 with strong CYP 3A4 and P-gp inhibitors, may lead to both reduced hepatic and renal clearance and thus significantly increased systemic exposure.

Co-administration of XARELTO with the azole-antimycotic ketoconazole (400 mg once daily) a strong CYP 3A4 and P-gp inhibitor, led to a 2,6-fold increase in mean rivaroxaban steady state AUC and a 1,7-fold increase in mean rivaroxaban C_{max} , with significant increases in its pharmacodynamic effects (see "Warnings").

Co-administration of XARELTO with the HIV protease inhibitor ritonavir (600 mg twice daily), a strong CYP 3A4 and P-gp inhibitor, led to a 2,5-fold increase in mean rivaroxaban AUC and a 1,6-fold increase in mean rivaroxaban C_{max} , with significant increases in its pharmacodynamic effects. Data on the co-administration of XARELTO with the HIV protease inhibitor ritonavir (100 mg twice daily) is not available.

Therefore XARELTO 15 and XARELTO 20 are not recommended in patients receiving concomitant systemic treatment with azole-antimycotics or HIV-protease inhibitors (see "Warnings").

Other active substances strongly inhibiting only one of the rivaroxaban elimination pathways, either CYP 3A4 or P-gp, are expected to increase rivaroxaban plasma concentrations to a lesser extent.

Clarithromycin (500 mg twice daily), considered a strong CYP 3A4 inhibitor and moderate P-gp inhibitor, led to a 1,5-fold increase in mean rivaroxaban AUC and a 1,4-fold increase in C_{max} . This increase, which is close to the magnitude of the normal variability of AUC and C_{max} , is considered as clinically not relevant.

Erythromycin (500 mg three times daily), which inhibits CYP 3A4 and P-gp moderately, led to a 1,3-fold increase in mean rivaroxaban AUC and C_{max} . This increase is within the magnitude of the normal variability of AUC and C_{max} and is considered as clinically not relevant.

Fluconazole (400 mg once daily), considered a moderate CYP 3A4 inhibitor, led to a 1,4-fold increase in mean rivaroxaban AUC and a 1,3-fold increase in mean C_{max} . This increase is within the magnitude of the normal variability of AUC and C_{max} and is considered as clinically not relevant.

Co-administration of XARELTO with the strong CYP 3A4 and P-gp inducer rifampicin led to an approximate 50 % decrease in mean rivaroxaban AUC, with parallel decreases in its pharmacodynamic effects (see "Pharmacokinetic properties").

The concomitant use of XARELTO 15 or XARELTO 20 with other strong CYP 3A4 inducers (e.g. phenytoin, carbamazepine, phenobarbitone or St. John's Wort) may also lead to a decreased rivaroxaban plasma concentration. Strong CYP 3A4 inducers should be co-administered with caution.

Pharmacodynamic interactions:

After combined administration of enoxaparin (40 mg single dose) with XARELTO 10 (10 mg single dose), an additive effect on anti-factor Xa activity was observed without any additional effects on clotting tests (PT, aPTT). Enoxaparin did not affect the pharmacokinetics of rivaroxaban (see "Warnings").

Clopidogrel (300 mg loading dose followed by 75 mg maintenance dose) did not show a pharmacokinetic interaction with XARELTO 15 but a relevant increase in bleeding times was observed in a subset of patients which was not correlated to platelet aggregation, P-selectin or GPIIb/IIIa receptor levels (see "Warnings").

No clinically relevant prolongation of bleeding time was observed after concomitant administration of XARELTO 15 and 500 mg naproxen. Nevertheless there may be individuals with more pronounced pharmacodynamic response (see "Warnings").

Converting patients from warfarin (INR 2,0 to 3,0) to XARELTO 20 or from XARELTO 20 to warfarin (INR 2,0 to 3,0) increased prothrombin time/INR (Neoplastin®) more than additively (individual INR

Approved Package Insert

values up to 12 may be observed), whereas effects on aPTT, inhibition of factor Xa activity and endogenous thrombin potential were additive.

If it is desired to test the pharmacodynamic effects of XARELTO 15 or XARELTO 20 during the conversion period, anti-Factor Xa activity, prothrombinase-induced clotting time (PiCT), and HepTest® can be used as these tests were not affected by warfarin.

From day 4 after stopping warfarin, all tests (including PT, aPTT, inhibition of factor Xa activity and ETP) reflected only the effect of XARELTO 15 or XARELTO 20 (see “Dosage and directions for use”).

If it is desired to test the pharmacodynamic effects of warfarin during the conversion period, INR measurement can be used at the C_{trough} of rivaroxaban (24 hours after the previous intake of rivaroxaban) as this test is minimally affected by rivaroxaban at this time point.

No pharmacokinetic interaction was observed between warfarin and XARELTO.

Interactions shown not to exist:

There were no mutual pharmacokinetic interactions between XARELTO and midazolam (substrate of CYP 3A4), digoxin (substrate of P-glycoprotein) or atorvastatin (substrate of CYP 3A4 and P-gp).

Co-administration of the proton pump inhibitor omeprazole, the H₂ receptor antagonist ranitidine, the antacid aluminium hydroxide/magnesium hydroxide, naproxen, clopidogrel or enoxaparin did not affect rivaroxaban bioavailability and pharmacokinetics.

No clinically significant pharmacokinetic or pharmacodynamic interactions were observed when XARELTO was co-administered with 500 mg acetylsalicylic acid.

Interactions with laboratory parameters:

Clotting parameter tests (PT, aPTT, HepTest®) are affected as expected by the mode of action of XARELTO 15 and XARELTO 20.

PREGNANCY AND LACTATION:

Women of childbearing potential:

XARELTO 15 and XARELTO 20 should be used in women of childbearing potential only with effective contraception.

Pregnancy:

Safety and efficacy of XARELTO 15 and XARELTO 20 have not been established in pregnant women.

In rats and rabbits rivaroxaban showed pronounced maternal toxicity with placental changes related to its pharmacological mode of action (e.g. haemorrhagic complications) leading to reproductive toxicity. No primary teratogenic potential was identified. Due to the intrinsic risk of bleeding and the evidence that rivaroxaban passes the placenta, XARELTO 15 and XARELTO 20 is contra-indicated in pregnancy (see “Contra-indications”).

Lactation:

Safety and efficacy of XARELTO 15 and XARELTO 20 have not been established in nursing mothers. In rats rivaroxaban is secreted into breast milk. Therefore XARELTO 15 and XARELTO 20 may only be administered after breastfeeding is discontinued (see “Contra-indications”).

DOSAGE AND DIRECTIONS FOR USE:

Approved Package Insert

There is no need for monitoring of coagulation parameters during treatment with XARELTO 15 and XARELTO 20.

Method of administration:

Oral use.

SPAF – Recommended usual dose and frequency of administration:

The recommended dose is one XARELTO 20 tablet once daily.

For patients with moderate renal impairment (creatinine clearance < 50 to 30 ml/min) the recommended dose is one XARELTO 15 tablet once daily.

XARELTO 15 and XARELTO 20 tablets should be taken with food.

SPAF – Duration of treatment:

Therapy should be continued as long as risk factors for stroke and systemic embolism persist.

SPAF – Missed dose:

If a dose is missed the patient should take XARELTO 15 or XARELTO 20 immediately and continue with the once daily intake as recommended on the following day.

The dose should not be doubled to make up for a missed dose within the same day.

SPAF – Maximum daily dose:

The recommended maximum daily dose is one XARELTO 20 tablet (20 mg rivaroxaban).

SPAF – Additional information on special populations:

SPAF – Patients with hepatic impairment:

XARELTO 15 and XARELTO 20 are contra-indicated in patients with hepatic disease with or without coagulopathy (see “Contra-indications”).

Limited clinical data in patients with moderate hepatic impairment (Child Pugh B) indicate a significant increase in the pharmacological activity.

No clinical data are available for patients with severe hepatic impairment (Child Pugh C) (see “Contra-indications” and “Pharmacokinetic properties”).

SPAF – Patients with renal impairment:

No dose adjustment is required if XARELTO 20 is administered in patients with mild (creatinine clearance \leq 80 to 50 ml/min) renal impairment. For patients with moderate (creatinine clearance < 50 to 30 ml/min) renal impairment the recommended dose is one XARELTO 15 once daily.

Limited clinical data for patients with severe renal impairment (creatinine clearance < 30 to 15 ml/min) indicate that rivaroxaban plasma levels are significantly increased in this patient population. Therefore XARELTO 15 must be used with caution in these patients.

Use of XARELTO 15 or XARELTO 20 is not recommended in patients with creatinine clearance < 15 ml/min (see “Warnings” and “Pharmacokinetic properties”).

SPAF – Converting from warfarin to XARELTO 15 or XARELTO 20:

Warfarin treatment should be stopped and XARELTO 15 or XARELTO 20 therapy should be initiated

Approved Package Insert

when the INR is $\leq 3,0$.

When converting patients from warfarin to XARELTO 15 or XARELTO 20, INR values will be falsely elevated after the intake of XARELTO 15 or XARELTO 20. The INR is not valid to measure the anticoagulant activity of XARELTO 15 or XARELTO 20, and therefore should not be used (see "Interactions").

SPAF – Converting from XARELTO 15 or XARELTO 20 to warfarin:

There is a potential for inadequate anticoagulation during the transition from XARELTO 15 or XARELTO 20 to warfarin. Continuous adequate anticoagulation should be ensured during any transition to an alternate anticoagulant. It should be noted that XARELTO 15 and XARELTO 20 can contribute to an elevated INR.

In patients converting from XARELTO 15 or XARELTO 20 to warfarin, warfarin should be given concurrently until the INR is $\geq 2,0$. For the first two days of the conversion period, standard warfarin dosing should be used followed by warfarin dosing guided by INR testing. While patients are on both XARELTO 15 or XARELTO 20 and warfarin, the INR should not be tested earlier than 24 hours (after the previous dose but prior to the next dose of XARELTO 15 or XARELTO 20). Once XARELTO 15 or XARELTO 20 is discontinued INR testing may be done reliably 24 hours after the last dose (see "Interactions").

SPAF – Converting from parenteral anticoagulants to XARELTO 15 or XARELTO 20:

For patients currently receiving a parenteral anticoagulant, start XARELTO 15 or XARELTO 20, 0 to 2 hours before the time of the next scheduled administration of the parenteral medicine (e.g. LMWH) or at the time of discontinuation of a continuously administered parenteral medicine (e.g. intravenous unfractionated heparin).

SPAF – Converting from XARELTO 15 or XARELTO 20 to parenteral anticoagulants:

Discontinue XARELTO 15 or XARELTO 20 and give the first dose of parenteral anticoagulant at the time that the next XARELTO 15 or XARELTO 20 dose would have been taken.

SPAF – Children and adolescents (from birth to 18 years):

Safety and efficacy have not been established in children and adolescents below 18 years.

SPAF – Body weight:

No dose adjustment is required based on body weight (see "Pharmacokinetic properties").

DVT and PE treatment – Recommended usual dose and frequency of administration:

The recommended dose for the initial treatment of acute DVT and PE is one XARELTO 15 tablet **twice daily** for the first three weeks followed by one XARELTO 20 tablet **once daily** for the continued treatment and the prevention of recurrent DVT and PE.

XARELTO 15 and XARELTO 20 tablets should be taken with food.

DVT and PE treatment – Duration of treatment:

Therapy should be continued as long as the VTE risk persists.

DVT and PE treatment – Missed dose:

It is essential to adhere to the dosage schedule provided.

If a dose is missed during the XARELTO 15 twice daily treatment phase the patient should take XARELTO 15 immediately to ensure intake of 30 mg per day. In this case two XARELTO 15 tablets

Approved Package Insert

may be taken at once. The patient should continue with the regular one XARELTO 15 twice daily intake as recommended on the following day.

If a dose is missed during the XARELTO 20 once daily treatment phase the patient should take XARELTO 20 immediately to ensure intake of 20 mg per day. The patient should continue with the regular one XARELTO 20 once daily intake as recommended on the following day.

DVT and PE treatment – Maximum daily dose:

The recommended maximum daily dose is 30 mg during the first 3 weeks of treatment.

In the following treatment phase the recommended maximum daily dose is 20 mg.

DVT and PE treatment – Additional information on special populations:

DVT and PE treatment – Patients with hepatic impairment:

XARELTO 15 and XARELTO 20 are contra-indicated in patients with hepatic disease with or without coagulopathy (see “Contra-indications”).

Limited clinical data in patients with moderate hepatic impairment (Child Pugh B) indicate a significant increase in the pharmacological activity.

No clinical data are available for patients with severe hepatic impairment (Child Pugh C) (see “Contra-indications” and “Pharmacokinetic properties”).

DVT and PE treatment – Patients with renal impairment:

No dose adjustment is required if XARELTO 15 and XARELTO 20 is administered in patients with mild (creatinine clearance ≤ 80 to 50 ml/min) or moderate (creatinine clearance < 50 to 30 ml/min) renal impairment (see “Pharmacokinetic properties”).

Limited clinical data for patients with severe renal impairment (creatinine clearance < 30 to 15 ml/min) indicate that rivaroxaban plasma levels are significantly increased in this patient population. Therefore XARELTO 15 and XARELTO 20 must be used with caution in these patients.

Use of XARELTO 15 and XARELTO 20 are not recommended in patients with creatinine clearance < 15 ml/min (see “Warnings” and “Pharmacokinetic properties”).

DVT and PE treatment – Converting from warfarin to XARELTO 15:

Warfarin treatment should be stopped and XARELTO 15 therapy should be initiated once the INR is $\leq 2,5$.

When converting patients from warfarin to XARELTO 15, INR values will be falsely elevated after the intake of XARELTO 15. The INR is not valid to measure the anticoagulant activity of XARELTO 15, and therefore should not be used (see “Interactions”).

DVT and PE treatment – Converting from XARELTO 15 or XARELTO 20 to warfarin:

There is a potential for inadequate anticoagulation during the transition from XARELTO 15 or XARELTO 20 to warfarin. Continuous adequate anticoagulation should be ensured during any transition to an alternate anticoagulant. It should be noted that XARELTO 15 and XARELTO 20 can contribute to an elevated INR.

In patients converting from XARELTO 15 or XARELTO 20 to warfarin, warfarin should be given concurrently until the INR is $\geq 2,0$. For the first two days of the conversion period, standard warfarin dosing should be used followed by warfarin dosing guided by INR testing. While patients are on both XARELTO 15 or XARELTO 20 and warfarin, the INR should not be tested earlier than 24 hours (after the previous dose but prior to the next dose of XARELTO 15 or XARELTO 20). Once XARELTO 15

Approved Package Insert

or XARELTO 20 is discontinued INR testing may be done reliably 24 hours after the last dose (see "Interactions").

DVT and PE treatment – Converting from parenteral anticoagulants to XARELTO 15:

For patients currently receiving a parenteral anticoagulant, start XARELTO 15, 0 to 2 hours before the time of the next scheduled administration of the parenteral medicine (e.g. LMWH) or at the time of discontinuation of a continuously administered parenteral medicine (e.g. intravenous unfractionated heparin).

DVT and PE treatment – Converting from XARELTO 15 or XARELTO 20 to parenteral anticoagulants:

Discontinue XARELTO 15 or XARELTO 20 and give the first dose of parenteral anticoagulant at the time that the next XARELTO 15 or XARELTO 20 dose would have been taken.

DVT and PE treatment – Children and adolescents (from birth to 18 years):

Safety and efficacy have not been established in children and adolescents below 18 years.

DVT and PE treatment – Body weight:

No dose adjustment is required based on body weight (see "Pharmacokinetic properties").

SIDE EFFECTS AND SPECIAL PRECAUTIONS:

Side effects:

Summary of the safety profile:

The safety of XARELTO has been evaluated in four phase III studies including 6097 patients exposed to XARELTO 10 (rivaroxaban 10 mg) undergoing major orthopedic surgery of the lower limbs (total hip replacement or total knee replacement) in 3997 hospitalised medically ill patients treated up to 39 days, and in three phase III VTE treatment trials with 4556 patients exposed either to XARELTO 15 (rivaroxaban 15 mg) twice daily for 3 weeks followed by XARELTO 20 (rivaroxaban 20 mg) once daily or to XARELTO 20 once daily treated up to 21 months.

Furthermore safety of XARELTO has also been evaluated in 7750 patients with non-valvular atrial fibrillation from two phase III trials with at least one dose of XARELTO 15 or XARELTO 20.

Due to the pharmacological mode of action, XARELTO 15 and XARELTO 20 may be associated with an increased risk of occult or overt bleeding from any tissue and organ which may result in post haemorrhagic anaemia. The risk of bleedings may be increased in certain patient groups e.g. patients with uncontrolled severe arterial hypertension, impaired renal and hepatic function and/or on concomitant medication affecting haemostasis (see "Warnings"). The signs, symptoms, and severity (including fatal outcome) will vary according to the location and degree or extent of the bleeding and/or anaemia (see "Known symptoms of overdosage and particulars of its treatment").

Haemorrhagic complications may present as weakness, paleness, dizziness, headache or unexplained swelling, dyspnoea, and unexplained shock. In some cases as a consequence of anaemia, symptoms of cardiac ischaemia like chest pain or angina pectoris have been observed.

Known complications secondary to severe bleeding such as compartment syndrome and renal failure due to hypoperfusion have been reported for XARELTO 15 and XARELTO 20. Therefore, the possibility of a haemorrhage should be considered in evaluating the condition in any anticoagulated patient.

Tabulated list of adverse reactions (ARs):

The frequencies of ARs reported with XARELTO 15 and XARELTO 20 are summarised in the table

below. Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

Frequencies are defined as:

very common ($\geq 1/10$),

common ($\geq 1/100$ to $< 1/10$),

uncommon ($\geq 1/1000$ to $< 1/100$),

rare ($\geq 1/10\ 000$ to $< 1/1000$).

Table 1: All treatment-emergent adverse reactions reported in patients in phase III studies.

System organ class (MedDRA)	Common	Uncommon	Rare
Blood and the lymphatic system disorders	Anaemia (incl. respective laboratory parameters)	Thrombocythaemia (incl. platelet count increased) ^A	
Cardiac disorders		Tachycardia	
Eye disorders	Eye haemorrhage (incl. conjunctival haemorrhage)		
Gastrointestinal disorders	Gingival bleeding Gastrointestinal tract haemorrhage (incl. rectal haemorrhage) Gastrointestinal and abdominal pains Dyspepsia Nausea Constipation ^A Diarrhoea Vomiting ^A	Dry mouth	
General disorders and administration site conditions	Fever ^A Peripheral oedema Decreased general strength and energy (incl. fatigue and asthenia)	Feeling unwell (incl. malaise)	Localised oedema ^A
Hepato-biliary disorders		Abnormal hepatic function	Jaundice
Immune system disorders		Allergic reaction Allergic dermatitis	
Injury, poisoning and postprocedural complications	Postprocedural haemorrhage (incl. postoperative anaemia, and wound haemorrhage) Contusion	Wound secretion ^A	Vascular pseudoaneurysm ^C
Investigations	Increase in transaminases	Increase in bilirubin Increase in blood alkaline phosphatase ^A Increase in LDH ^A Increase in lipase ^A Increase in amylase ^A Increase in GGT ^A	Increase in conjugated bilirubin (with or without concomitant increase of ALT)
Musculoskeletal, connective tissue and bone disorders	Pain in extremity ^A	Haemarthrosis	Muscle haemorrhage
Nervous system disorders	Dizziness Headache	Cerebral and intracranial haemorrhage Syncope	

Renal and urinary disorders	Urogenital tract haemorrhage (incl. haematuria and menorrhagia ^B) Renal impairment (incl. blood creatinine increased, blood urea increased) ^A		
Respiratory tract disorders	Epistaxis Haemoptysis		
Skin and subcutaneous tissue disorders	Pruritus (incl. uncommon cases of generalised pruritus) Rash Ecchymosis Cutaneous and subcutaneous haemorrhage	Urticaria	
Vascular disorders	Hypotension Haematoma		

^A observed after major orthopedic surgery of the lower limbs

^B observed in VTE treatment as very common in women < 55 years

^C observed as uncommon in prevention therapy in ACS (following percutaneous intervention)

Special precautions:

See "Warnings".

Information about excipients:

Since XARELTO 15 and XARELTO 20 contain lactose, patients with rare hereditary problems of lactose or galactose intolerance (e.g. the Lapp lactase deficiency or glucose-galactose malabsorption) should not take XARELTO 15 or XARELTO 20.

Effect on ability to drive or use machines:

Syncope and dizziness have been reported and may affect the ability to drive and use machines (see "Side effects"). Patients experiencing these adverse reactions should not drive or use machines.

KNOWN SYMPTOMS OF OVERDOSAGE AND PARTICULARS OF ITS TREATMENT:

Rare cases of overdose up to 600 mg have been reported without bleeding complications or other adverse reactions. Due to limited absorption a ceiling effect with no further increase in average plasma exposure is expected at supratherapeutic doses of 50 mg or above.

A specific antidote antagonising the pharmacodynamic effect of XARELTO 15 and XARELTO 20 is not available. The use of activated charcoal to reduce absorption in case of XARELTO 15 and XARELTO 20 overdose may be considered. Due to the high plasma protein binding rivaroxaban is not expected to be dialysable.

Management of bleeding:

Should a bleeding complication arise in a patient receiving XARELTO 15 and XARELTO 20, the next administration should be delayed or treatment should be discontinued as appropriate. Rivaroxaban has a half-life of approximately 5 to 13 hours. Management should be individualised according to the severity and location of the haemorrhage. Appropriate symptomatic treatment could be used as needed, such as mechanical compression (e.g. for severe epistaxis), surgical haemostasis with

Approved Package Insert

bleeding control procedures, fluid replacement and haemodynamic support, blood products (packed red cells or fresh frozen plasma, depending on associated anaemia or coagulopathy) or platelets.

If bleeding cannot be controlled by the above measures, administration of a specific procoagulant reversal agent should be considered, such as prothrombin complex concentrate (PCC), activated prothrombin complex concentrate (APCC), or recombinant factor VIIa (r-FVIIa). However, there is currently very limited clinical experience with the use of these products in individuals receiving XARELTO 15 or XARELTO 20.

Protamine sulphate and Vitamin K are not expected to affect the anticoagulant activity of XARELTO 15 or XARELTO 20.

There is no experience with antifibrinolytic agents (tranexamic acid, aminocaproic acid) in individuals receiving XARELTO 15 or XARELTO 20. There is neither scientific rationale for benefit nor experience with the systemic haemostatics desmopressin and aprotinin in individuals receiving XARELTO 15 or XARELTO 20.

IDENTIFICATION:

XARELTO 15: Round, biconvex, red film-coated tablets, 6 mm in diameter, 9 mm radius of curvature, debossed with a triangle over "15" on the top side and the BAYER cross on the bottom side of the tablet.

XARELTO 20: Round, biconvex, brown red film-coated tablets, 6 mm in diameter, 9 mm radius of curvature, debossed with a triangle over "20" on the top side and the BAYER cross on the bottom side of the tablet.

PRESENTATION:

XARELTO 15 film-coated tablets are packed in colourless, transparent PP (polypropylene)/aluminium blister strips or colourless, transparent PVC/PVDC/aluminium blister strips. Pack sizes: 14 tablets, 28 tablets, 42 tablets, 98 tablets or 100 tablets.

XARELTO 20 film-coated tablets are packed in colourless, transparent PP (polypropylene)/aluminium blister strips or colourless, transparent PVC/PVDC/aluminium blister strips. Pack sizes: 14 tablets, 28 tablets, 42 tablets, 98 tablets or 100 tablets.

STORAGE INSTRUCTIONS:

Store at or below 30 °C. Keep blister strips in the original carton until use.
KEEP OUT OF REACH OF CHILDREN.
